

## Security Alarm Summary

**Time Period:** Wednesday, July 29, 2009 9:23:31 AM

**Description:** This report provides a summary of alarms (Security IDS/IPS and Performance Intrusion) that exist on the 802.11 network. The security summary shows if your network, company data, or company resources are vulnerable to attack. An insecure network can usually be fixed by reconfiguring some of the network equipment, by using additional software or hardware and always being in the forefront of implementing the latest security standards to provide good security for sensitive data such as employee salary data or company financial information.

A closely monitored and well tuned WLAN system can achieve a higher throughput than a poorly managed one. AirMagnet ensures WLAN performance and efficiency by monitoring the WLAN and alerting the wireless administrator on early warning signs for trouble. With the comprehensive suite of security monitoring technologies, AirMagnet alerts the user on more than 120 different threat conditions.
